ENVIRONMENTAL ECONOMICS / RESEARCH SEMINAR

Air Pollution

Exposure, evidence, and environmental policy

Presenter Name

Department / Institution / Research seminar

Begin with a precise exposure question

- Name the pollutant and its measurement unit.
- Define the population and the exposure window.
- Select an outcome with a clear interpretation.
- State the policy comparison of interest.

Template example: replace this research outline with your study and citations.

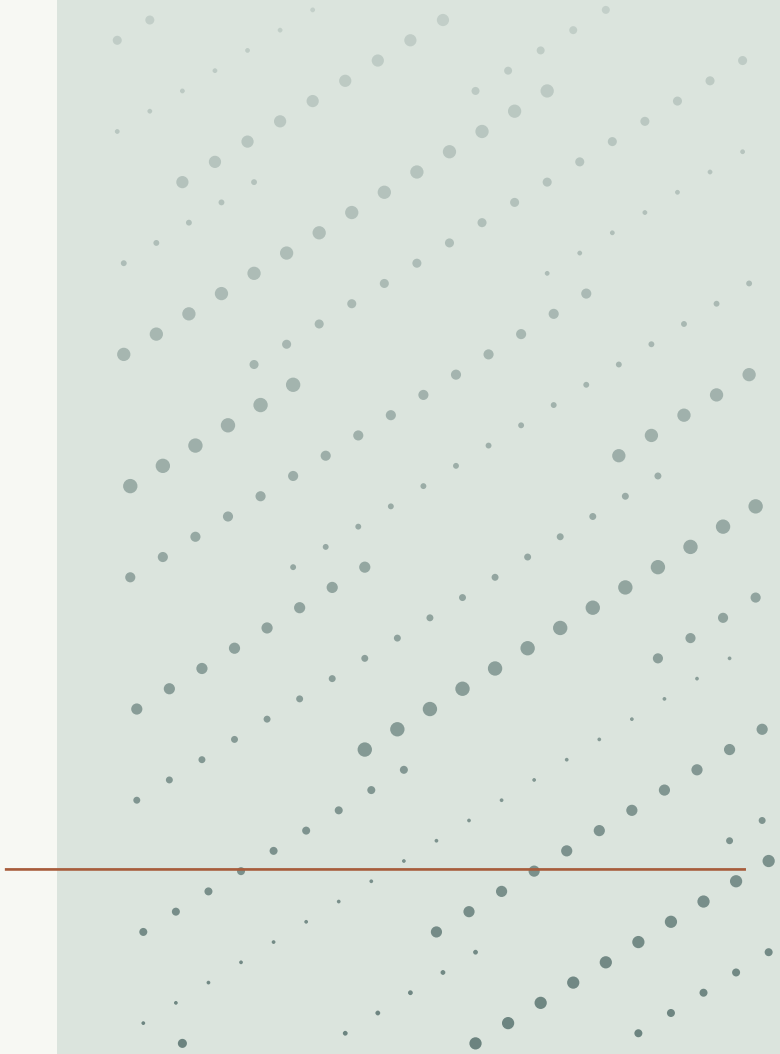

Make the comparison explicit

How does a change in exposure affect outcomes?

01	02	03
Exposure	**Population**	**Outcome**
Pollutant and time window	People and places at risk	Measure and follow-up

From exposure to evidence

Measurement. Comparison. Interpretation.

Align exposure with people and time

- Match pollution measures to a defined location.
- Document monitor coverage and missing records.
- Align weather controls with the exposure window.
- Report aggregation rules and sample restrictions.

Data sources, geographic units, and sample dates belong here.

An equation makes the estimand visible

$$Y_{it} = \underbrace{\beta}_{\text{target}} P_{it} + X_{it}'\gamma + \alpha_i + \lambda_t + \varepsilon_{it}$$

- P_{it} measures exposure for unit i at time t.
- α_i and λ_t absorb unit and time effects.
- A causal interpretation needs a credible design.

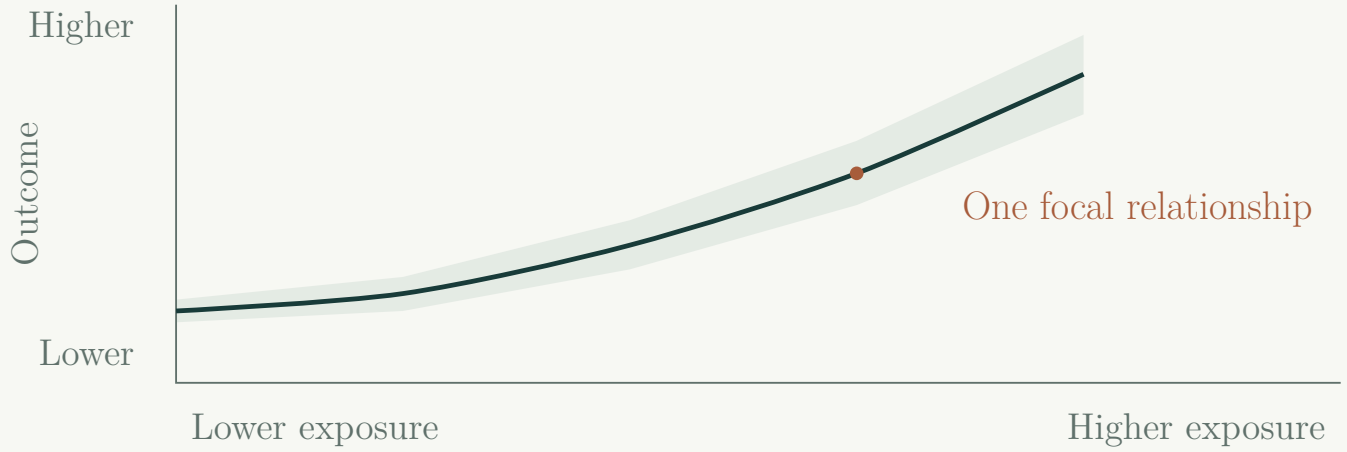

Illustrative specification only; adapt controls and inference to the actual design.

State what makes the comparison credible

- Describe the source of exposure variation.
- Explain the identifying assumption in plain language.
- Show diagnostics that can challenge the design.
- Discuss remaining threats to interpretation.

Choose diagnostics for the actual design; fixed effects alone do not establish causality.

Give each figure one message

Schematic only: the curve and shaded envelope are layout examples, not estimates or confidence intervals.

Report magnitude together with uncertainty

- Express the estimate in meaningful exposure units.
- Show an interval and explain the inference method.
- Compare the effect with the baseline outcome mean.
- Separate the estimate from the policy extrapolation.

Insert verified results and citations. This recipe supplies no empirical findings.

AIR POLLUTION / DISCUSSION

Clear questions. Credible evidence.

Bring the discussion back to the estimand.
