ECONOMICS RESEARCH SEMINAR

Politics on the Menu

Political Identity, Consumer Sorting, and Restaurant Engagement

Your Name

Department of Economics / Your University

April 12, 2024

01 Motivation

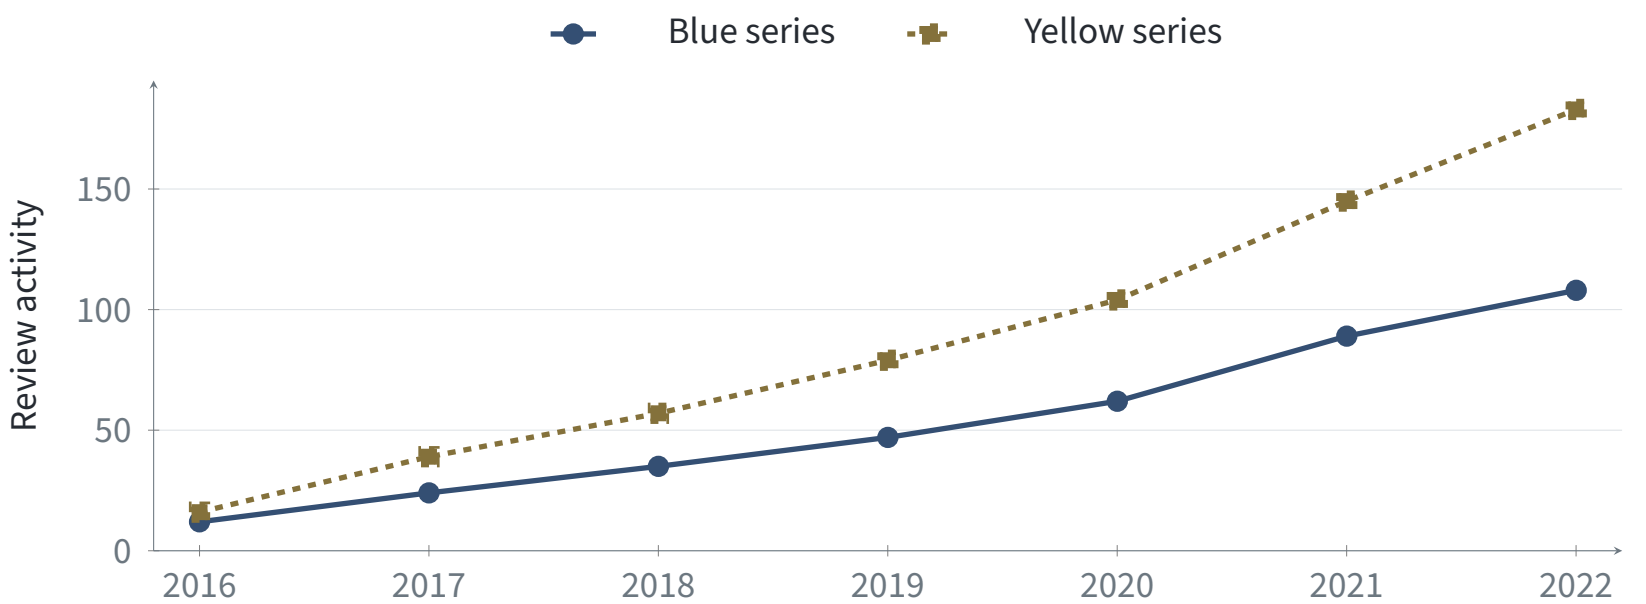

Political identity. Everyday choices.

Political identity enters everyday choices

- Political identity may shape where people spend time and money.
- Restaurants provide a social setting beyond explicit politics.
- The study examines choice, engagement, and consumer sorting.

Where people eat provides a setting for studying identity and choice.

Two series describe growing review activity

Illustrative series retained from the supplied demo. Units and data provenance were not supplied.

02 Data

Political identity. Everyday choices.

The archive links reviews to restaurant groups

OpenRice review archive

- 2,269,004 eligible reviews.
- 260,911 reviewers.
- 39,199 establishments.
- Research window: 2016–2025.

District-resolved eligible review sample.

Three-color classification

Group	Restaurants
Yellow	3,837
Blue	2,469
White	32,893

> Color labels are measurement devices; White does not mean politically neutral.

03 Empirical Strategy

Political identity. Everyday choices.

Three comparisons organize the empirical design

1. Compare allocation across fixed restaurant color groups.
2. Match restaurants around first qualifying Yellow reviews.
3. Estimate conditional review choice across the three colors.

The design summary is retained from the supplied demonstration.

From review records to reported outcomes

Keep the measurement chain visible

Separate the source, classification, comparison, and reported outcome.

Schematic workflow for the supplied example; arrows indicate presentation order, not causal effects.

Separate definitions, conditions, and interpretation

Definition / restaurant groups

Color labels classify establishments. White does not mean politically neutral.

Model condition / availability

Make the mapping from recorded stock to feasible choices explicit.

Interpretation / observed outcomes

Reviews and ratings do not directly measure tastes, transactions, or welfare.

Standard Beamer block, alertblock, and exampleblock environments share the same typographic hierarchy.

Distinguish two questions about restaurant engagement

Local attention

- First qualifying Yellow reviews.
- Matched restaurant comparisons.
- Review counts and ratings.

Conditional allocation

- Review choice across colors.
- District-quarter activity held fixed.
- Recorded restaurant stock held fixed.

> Local attention gains can coexist with weaker later attraction.

04 Results

Political identity. Everyday choices.

Report count and rating estimates together

	Count	Rating
Months +1 to +3	0.233***	0.983***
	(0.031)	(0.242)
Months +4 to +6	0.251***	1.289***
	(0.036)	(0.258)
Months +7 to +12	0.192***	1.031***
	(0.042)	(0.243)

Illustrative layout using supplied manuscript estimates. Parenthetical values and stars are preserved verbatim.

Units, inference details, significance thresholds, and full model statistics were not supplied; verify before use.

Early attraction depends on the availability model

- Estimated availability makes early Yellow attraction model-sensitive.
- Availability differs from proportional adjustment.
- The late negative Yellow index persists across specifications.

> **Model object**
>
> Conditional allocation across colors, holding district-quarter activity and recorded restaurant stock fixed.

The reopening-period decline persists in the supplied demonstration.

05 Conclusion

Political identity. Everyday choices.

Interpret the outcomes that are actually measured

- Sorting, public identity, and business evaluation are distinct.
- Local attention gains can coexist with weaker later attraction.
- The evidence concerns recorded reviews and ratings.

> Reviews and ratings do not directly measure tastes, transactions, or welfare.
